Abstract. Many multi-owned condominiums need an energy renovation, but in practice the number of such renovations is low. Dutch policy emphasizes the need to search for cost-neutral renovation solutions. This study therefore examined how the number of living-cost neutral renovations of buildings owned by assemblies of homeowners in the Netherlands can be increased by means of an integrated unburdening offer that includes energy performance guarantees and supply chain integration. The study uses scientific literature, project experiences and in-depth interviews with experts to examine how policy, demand and supply currently play a role in the upscaling of living-cost neutral renovations. The study finds that customized guidance is needed for condominium associations to steer their maintenance decision processes towards deep renovations. Also chances are detected to link living cost neutrality with energy neutrality, while developing an integrated supply chain that takes into account full process guidance including the provision of performance guarantees. This is now already successfully implemented in a new non-profit service desk and a new process model will be tested in multiple regions.

1. Introduction
Condominiums are the most common residential building type in the EU: 42% of residential buildings in the EU are apartments, mostly in major cities. Similar to other residences, a large portion of the existing condominium stock was built before the introduction of thermal insulation standards, needs renovation in the near future, and gets renovated only at a slow pace [1,2]. In The Netherlands about 60% of the homes owned by condominium associations (CAs) was even built before the war [3]. Compared to the renovation of single-family owned dwellings or condominiums owned by a housing association, renovations of condominiums with multiple owners are hindered by slow adoption processes, as the investment decisions are made by owners represented in CAs, who usually gather only once a year. The renovation processes are slowed down by the needed guidance of inhabitants and complex decision-making is the rule [4]. Furthermore, there are concerns that the renovations might lead to higher total living costs [5]. On the other hand there might also be substantial reductions in energy costs, which could possibly reduce total living costs. Also, the volume and budget of condominium energy renovations make it interesting for suppliers to offer services for this target group. It thus makes sense to look into the opportunities of developing a construction supply chain offer for living-cost neutral condominium renovations.
2. Research approach

2.1. Context
This paper is an elaboration of the results of the MMIP-IEBB project 7.5 “Woonlasten-neutrale renovatie (WNR)”, which were previously presented in Dutch [6]. The project aimed for a practice consortium composed of Servicebureau WNR (a non-profit organization established during the project), DNA in de Bouw (an association of innovative contractors and service providers) and knowledge institutes KERN and TU Delft to stimulate supply chain innovation to develop the market penetration of energy renovation for CAs. The project emphasized the empowering of the enthusiasm of building owners and the upscaling of small-scale renovations with SME’s by means of open innovation, particularly to develop an offer for CAs.

2.2. Research question and approach
The research tried to answer the question: How can living-cost neutral renovations of buildings owned by condominium associations be upscaled?. The research investigated this question from three viewpoints - policy, demand and supply - to find synergies while creating policy recommendations, and investment strategies for seducing homeowners and companies’ innovation and supply chain integration.

2.3. Research method
This research was supported by literature study, desk research of European projects and results from semi-structured in-depth interviews developed in the IEA EBC Annex 75 “Cost-effective Building Renovation at District Level Combining Energy Efficiency and Renewables” [7]. The interviewees (see Table 1) were Dutch frontrunners experienced with the concept of living-cost neutral home renovations. The interviews took about 1.5 hours per person, were recorded and were analyzed to obtain a PESTLE/SWOT analysis. The results were coded according to the topics policy, business model and stakeholder dialogue to compare relevant data.

3. Research results
In the following sub sections the main results per viewpoint are discussed: policy, demand and supply.

3.1. Policy
The European Commission [2] wants to halve the energy use in buildings in 2050 compared to 2005, hereby stimulating a higher renovation rate and more deep renovations. The Renovation Wave strategy [8] as core part of the European Green Deal, aims to build up an industrialized renovation sector and stimulate financial actors to transform existing buildings into nearly zero-energy buildings with a healthy indoor climate, to reach an annual renovation rate of 3%, to improve equal access to finance taking into account the affordability and the financial capacities of vulnerable households, and to gradually phase out the buildings with the worst energy performance labels. This implies a strengthening of energy renovation loans, energy performance contracts, reducing investment risks and providing integrated home renovation services including smart financing [1]. Policy development has to include
strategies for renovation of condominiums, taking into account supply chain integration, coupling of
demand and supply, and smart processes that take into account the energy performance certification,
bringing audits, renovation plans, ownership structures and possible supporting mechanisms [9].

The Netherlands subscribed to the EU goal for a carbon-free built environment in 2050, but policy
strategies are still developing. In 2019 in the Netherlands, about 9% of all greenhouse gas emissions or
about 70% of the total emissions in the built environment were still originating from the residences
[10,11]. Meanwhile the development of energy renovations is too slow [10,12,13] and suffering from a
lack of deep renovations [14]. While the current government emphasizes the need for one million new
homes, about 7 million homes and 1 million buildings are still poorly insulated and heated with gas [15].
According to the Dutch climate law 1.5 million homes need to be handled by 2030 [11] and 200.000
homes should be able to disconnect from the gas supply [16].

To improve the situation Multi-annual Mission driven Innovation Programs (MMIP’s) followed
programs such as the Energy Leap/ “Energiesprong” [17], the Renovation Accelerator [18] for rented
dwellings, the program Gas-free neighborhoods [19] and the Human Capital Agenda [20]. The MMIP’s
support the development of integrated renovation concepts, industrialization and digitization of
renovation processes and the central positioning of building owners and users [16,21].

The Dutch Climate Council emphasizes the need for balancing monthly payments for a renovation
loan with the advantages on the energy bill, possibly completed with customized support [15].
Particularly for social rented dwellings the average real saving on the energy costs should not be lower
than the rise of the rent or service costs after renovation [22]. Loans of the National Heat Fund were also
made available for CAs. This allows to obtain maximum €50.000 for a “Highly Energy-Efficient”
renovation package and €65.000 for a “Zero-on-the-meter” package with a payback of 10 to 30 years
(de Koning and Paradies in [23]).

Interviewees find that there are still many policies that could be strengthened, for example related to
taxation, guarantees (I-1; I-3), innovation (I-3), hereditary tenure or change of ownership (I-3; I-5; I-7),
equal access to financing (I-5; I-6; I-7) and process guidance (I-1; I-5; I-6), particularly addressing
integrated home renovation services (I-5) and combinations of measures (I-2).

Local and regional authorities also could play an important role as in the Dutch context they are
responsible for setting up plans for gas-free districts and regional energy strategies, which in turn might
be coupled with renovation strategies. Many municipalities also already offer an energy advice desk,
and experts recommend these should advance towards better reaching out to districts (I-2; I-4; I-6).
Particularly there is a need to develop towards process guidance for groups of homeowners (I-1; I-2; I-
5), local renovation hubs [24], integrated renovation offers including unburdening of financing and
guarantees (I-6; I-7) and digital communication (I-2; I-6).

District approaches seem to be complex though, requiring intensive stakeholder dialogue and
considerable means and competencies. Nowadays they seem to be too focused on heat grid development
(I-3; I-4; I-6), even without requirements regarding supply temperature or use of renewable energy
sources (I-6) or transparency of connection costs (I-1; I-3; I-5).

The Dutch government [25] asked the municipalities to look beyond the development of living-cost
neutral approaches and to improve also the indoor comfort, the development of real estate value, the
living and financial conditions of the inhabitants, and the livability of the districts. Interviewees
commented it might be crucial to also facilitate groups of inhabitants or collective units (I-1; I-2; I-3; I-
5), particularly bottom-up initiatives (I-3; I-5; I-6), while also engaging energy communities (I-6) or
societal ESCo’s (I-7) and supporting group buying initiatives (I-2).

Overall, the literature and empirical research found that currently Dutch national policy still doesn’t
give or support a clear direction and adequate communication to target deep renovations including
energy efficiency and renewable energy systems. In this context, policy development should target CAs
by providing appropriate guidance processes for achieving integrated renovations.
3.2. Demand

Data show that the market for renovating buildings owned by CAs deserves attention. In 2015 in the Netherlands there were about 144,000 CAs related to about 1.2 million homes, a majority of which was privately owned [3]. About 45% of the CAs can be found in Dutch cities [4], with 30 to 50% concentrations within the four major cities [26]. About 75% of all CAs can be found in the provinces of Utrecht, South Holland and North Holland [3]. 40% of the CA owned buildings consists of maximum 2 living units, 40% has 3 to 10 living units and the rest has more than 10 living units [4]. Only about one third of the CAs is governed by one of the 550 management offices (communication Bouwkennis). The associated real estate values are relatively low and the household incomes relatively average [3].

There have been numerous studies about what drives or hinders individual homeowners in their renovation decision-making [27,28,29,30]. Results can be more promising when the decision processes are socially steered and influenced by influential people in the surroundings [31,32]. Important success factors are that the owners already detected a renovation need [33], that the whole customer renovation journey is guided [29,34] by trusted actors [35], who offer services beyond the first consultations [17,36,37]. Providing personalized access to financing plays a crucial role [28,38,39]. For owners also the rise of the real estate value after renovation plays a role [11,40,41]. For tenants the financial profit of energy production [11] might count. For building renovations decided by CAs the business case should be attractive and related to the multi-annual maintenance plan and the collective finances [4].

Literature shows that there are important legal and administrative hindrances when targeting multi-owned buildings. CAs can still be dormant or non-existent [3]. Ownership legislation could hinder reaching out to CAs [42]. For many CAs changing or establishing a deed of division is still too cumbersome [43]. A minimum reserve fund should be available, which is currently no obligation [26].

Interviewees recognize these observations and believe that a maximum exploitation of opportunities can lead to a larger acceptance of investing in more renovation measures beyond maintenance (I-1; I-5; I-7). CA administrators and managers are perceived as a primary influential target group that could also be better trained on administrative, maintenance and sustainable renovation matters (I-1). All interviewees found creative ways to communicate with and motivate homeowners, usually focusing on messages of increased comfort (I-1; I-4; I-5), energy cost savings (I-1; I-2; I-4) and smooth processes with energy performance guarantees after renovation (I-1; I-5). The needed coaching of energy renovations is emphasized (I-1; I-2; I-5; I-6), which needs the development of a sound business case (I-1; I-3), a collective approach to facilitate decision processes (I-1; I-2; I-5), and equal access for vulnerable households to financing (I-2; I-4; I-7).

Overall the research found that to upscale living-cost neutral renovations there is a need for customized CA support to arrange the whole renovation journey, including solving administrative and legal hurdles, detailed advice and training for the CA. Customized design, process management and financing solutions should be developed and coupled to performance guarantees and personal access to finance. Policy could support identification of CAs whose buildings are in need of renovation and direct to integrated home renovation service providers that specifically target process guidance of CAs.

3.3. Supply

The research identified a need for better supply chain integration to support living-cost neutral renovations. The renovation sector is highly fragmented and consists mainly of SME’s with insufficient R&D means, knowledge and time [6,44]. Construction and installation companies are barely active in demand creation [45], and in the follow-up of the installations [46]. They are difficult to engage as they like to avoid risks compared to business as usual [47]. Zero-on-the-meter renovation concepts and installations as well as process guidance can still be improved [48].

Supply activating policy focuses mainly on standardization and cost efficiency by means of industrialization and digitization [16,21], but supply chain collaboration is key for supplying integrated home renovation services. Essential is the systemic collaboration with neutral trusted advisers [34,49] such as real estate professionals, financial actors (banks, ESCo’s, insurance companies), authorities and non-profit organizations that can manage customer relationships [44,47]. Other key factors are the establishment of stable consortia and efficient team work [50,51], the integration of quality
assurance [47,52] for customer confidence [50], planning to maximize energy savings [53]; step-wise approaches for CAs [54], social marketing and efficient customer communication [23,55]. The financing arrangements need to be coupled to quality and energy performance ([1] Art. 33).

Interviewees acknowledged the specific complexities of condominium renovations and point to the need for processes that integrate specific incentives, guarantees and policies to support CA decision-making (I-1; I-2; I-3; I-5; I-7). They confirmed the importance of integrated offers (I-2; I-6; I-7) and the need to work closely together with CA administrators and managers (I-1; I-4; I-5; I-6), neutral advisors or architects (I-1; I-3; I-4; I-5; I-7), financing intermediaries that can cover market failures (I-1; I-3; I-5; I-7), municipalities (I-1; I-2; I-6), energy providers - particularly energy cooperatives (I-2; I-3; I-6) - , and specialized communication agents that can connect with various types of stakeholders (I-3; I-5; I-6). Also they pointed to a current lack of knowledge and training for contractors and installers (I-3; I-6), and lack of the guarantees these actors provide (I-5; I-7).

4. Discussion and outlook

The analysis results supported the establishment and development of a new Dutch non-profit organization “WNR”, that has a specific mission to support the upscaling of the market for living-cost neutral condominium renovations. As a service desk WNR now actively approaches CAs and supports energy renovation decision-making during CA assembly meetings, in view of progressing to offering a step-by-step integrated approach including feasibility studies, design plans, execution and quality assurance of condominium renovations [56]. As a unique customer value WNR offers a 30-year guarantee for the energy performance after renovation, aiming at about 90% energy reduction on building level after renovation. WNR will work together with a pool of advisors and contractors that will be trained and certified to offer living-cost neutral condominium renovations. WNR is supported by actors who already delivered successful condominium renovations using this framework [57]. WNR also progressed to working together with local authorities. Further strengthening of supply chain collaborations is planned in view of addressing the issues described previously. The model will now be tested in multiple regions in the framework of a LIFE-project.

5. Conclusion

This study aimed to determine opportunities for upscaling living-cost neutral renovations of condominiums owned by condominium associations (CAs). The research used literature and in-depth interviews with experts to determine policy, demand and supply chain development chances.

The upscaling of living-cost neutral renovations fits well within European and national policy, particularly when the goal is to combine energy neutrality with living cost neutrality. From a policy perspective it is important to also address a healthy indoor climate and equal access to financing for all members of a CA. European policy is in favour of more integration of advice, execution, financing and process guidance to unburden dwellers, and supports the development of integrated home renovation services and energy performance contracting. In the Netherlands this development is not yet in full view. While policy makers address individual homeowners and gas-free district approaches, the intermediate level of renovating buildings with multiple owners deserves specific further attention. Specifically CA administrators and managers require integrated process guidance towards deep renovation.

There is a huge potential in the Netherlands to renovate condominiums owned by CAs. There are various hurdles but also new opportunities to stimulate collective action and better management of condominiums. An appropriate offer for CAs that integrates performance guarantees and administrative and financing solutions could possibly seduce more CAs to start a deep renovation. Bundling of renovation demand could further stimulate upscaling and innovation of the supply chain.

The duration and the complexity of CA decision-making processes should not be underestimated. Customized solutions are needed to approach and consult CAs, taking into account possible legal barriers, administrative issues, detailed performance assessment, guarantee plans for CAs and service providers alike, and financial planning making use of reserve funds and multi-annual maintenance plans. In this sector a transformation is needed via open innovation and new supply chain partnerships that are
trained and certified for providing quality, energy performance guarantee based collaboration. WNR showed that these concerns and complexities can already be transformed into a viable business model.

Acknowledgements
The project WNR was implemented with support from the MMIP 3&4 scheme of the Ministry of Economic Affairs & Climate Change and the Ministry of the Interior & Kingdom Relations. The Dutch participation to the IEA EBC Annex 75 “Cost-effective Building Renovation at District Level Combining Energy Efficiency & Renewables” was done with the support from EIT Climate-KIC and the Netherlands Enterprise Agency (VOO). This paper was written to support the project LIFE21-CET-HOMERENO-CondoReno (101076316).
